This map reflects potential tidal flooding from hurricanes based on storm surge heights calculated by the National Weather Service's SLOSH (Sea, Lake, and Overland Surges from Hurricanes) Model. The SLOSH Basin used for mapping was Wilmington/Myrtle Beach v3 (2010).

SLOSH storm surge elevations represent the "worst case" combinations of direction, forward speed, landfall point, and astronomical tide for each category. Categories 1 through 5 refer to the Saffir-Simpson scale of hurricane intensity. These surge elevations do not include wave heights that may accompany storm surge.

This hurricane storm surge map was produced by the U.S. Army Corps of Engineers, Wilmington District. It is made available for review by the State of North Carolina, local government emergency management agencies, and other interested agencies.
