HOW TO DISINFECT YOUR WELL

To disinfect your home water system, you must completely spread chlorine throughout the well and plumbing system.

Disinfection can be done by pouring the following amount of non-scented household bleach (5.25 % available chlorine) into the well as per the chart below:

Depth Of Well	DIAMETER OR SIZE OF WELL CASING						
01 // 011	2 in.	4 in.	6 in.	10 in.	18 in.	20 in.	24 in.
10Ft.	1.6 gallons	6.9 gallons	11.5 gallons	41.0	132.5 gallons	164 gallons	235 gallons

	Bleach	Bleach	Bleach	Bleach	Bleach	Bleach	Bleach

Rinse the well casing and any other equipment inside the well with the chlorine. Turn on all the water faucets in the home until you smell a strong chlorine odor. Turn the faucets off and let the chlorine stand in the well and plumbing system for at least 24 hours. Connect a garden hose to an outside faucet and run water away from house foundation and septic tank system until the chlorine smell is gone. Do not pump the highly chlorinated water into a septic system.

After the disinfection process has been completed, contact your local health department to have the water sampled. Continue using bottled water or water that has been boiled at a rolling boil for 3 minutes until sampling shows no contamination.

Since boiling water concentrates levels of nitrates in water, young infants and pregnant women should use bottled water instead of boiled tap water for drinking and cooking.
